

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1.(Currently Amended) An apparatus for receiving a digital information signal comprising at least a first video signal and second video signal, said apparatus comprises:

a receiver for receiving said digital information signal;

first retrieval unit for receiving said digital information signal and retrieving said first video signal from the received digital information signal;

second retrieval unit for receiving said digital information signal and retrieving said second video signal from the received digital information signal; and

signal combination unit for combining said first video signal and said second video signal so as to obtain a composite video signal suitable for displaying on a display unit,

wherein the first video signal forms, on display, a sequence of images having a first size, and the second video signal forms, on display, a sequence of images having a second size, the second size being smaller ~~then~~ than the first size of the images, the signal combination unit combining the first and second video signals while keeping the size of the

images corresponding to the second video signal unchanged, and wherein the digital information signal further comprises a parameter signal indicative for the location where the second video signal has to be overlaid on top of the first video signal, and the apparatus further comprises third retrieval unit for receiving said digital information signal and retrieving the parameter signal, the signal combination unit overlaying the second video signal on top of the first video signal in dependence on said parameter signal.

Claim 2 (Canceled)

3.(Previously Presented) The apparatus as claimed in claim 1, wherein the digital information signal is in the form of an MPEG transport stream.

4.(Previously Presented) The apparatus as claimed in claim 1, wherein the digital information signal is recorded on a record carrier, the receiver reading the digital information signal from said record carrier.

Claim 5 (Canceled)

6.(Currently Amended) A record carrier in the form of a storage medium readable by a device, the record carrier having a digital information signal recorded thereon, the digital

information signal comprising a first video signal and a second video signal, wherein the first video signal forms, on a display, a sequence of images having a first displayed size, and the second video signal forms, on the display, a sequence of images having a second displayed size, the second displayed size of the images being smaller than the first displayed size, wherein the digital information signal further comprises a parameter signal indicative for a location where the second video signal has to be overlaid on top of the first video signal when said first and second video signals are to be combined to form a composite video signal, and wherein the digital information signal further comprises a separate playlist ~~consisting of~~ comprising the second video signal and items having a displayed size smaller than the first displayed size for selection of the second video signal or the items by a user for display on the display.

Claim 7 (Canceled)

8.(Currently Amended) An apparatus for providing a digital information signal, said apparatus comprising:

an input unit for receiving a first video signal and a second video signal, the first video signal forming, on a display, a sequence of images having a first displayed size;

a signal combination unit for combining said first and second video signals so as to form said digital information signal; and

an output unit for providing said digital information signal,
wherein the apparatus comprises video processor for processing the second video signal so as to obtain a processed second video signal forming, on the display, a sequence of images having a second displayed size, wherein the second displayed size is smaller than the first displayed size of the images, the signal combination unit combining the first video signal and the processed second video signal while retaining all video information in the first and processed second video signals so as to form said digital information signal, and a device for generating a control signal for indicating a location where the second video signal is to be overlaid on top of the first video signal, wherein the signal combination unit combines the control signal with the first video signal and the second video signal in forming the digital information signal, and wherein the digital information signal further comprises a separate playlist comprising the second video signal and items having a displayed size smaller than the first displayed size for selection of the second video signal or the items by a user for display on the display.

9.(Currently Amended) The apparatus as claimed in claim 8, ~~characterized in that~~ wherein the output unit writes the digital information signal onto a record carrier.

10.(Previously Presented) The apparatus of claim 1, wherein the receiver receives the first video signal from a first source and receives the second video signal from a second

source which is different from the first source.

11.(Previously Presented) The apparatus of claim 8, wherein the control signal comprises information where the apparatus can find the second video signal, and an application which offers users a menu to enables the user to select the second video signal from a plurality of second video signals.
